--------------	-------------------------------------

Description

Miscellaneous functions for analysis of species association and niche overlap.

Details

Package:	spaa
Type:	Package
Version:	0.2.5
Date:	2024-12-23
License:	GPL-2
LazyLoad:	yes

Author(s)

Author: Jinlong Zhang <jinlongzhang01@gmail.com>
 Maintainer: Jinlong Zhang <jinlongzhang01@gmail.com>

Examples

```
data(testdata)
testdata

data(splist)
splist

### data tranformation
(spmatrix <- data2mat(testdata))
#Species association
sp.assoc(spmatrix)
```

```
# Species association between each pair of species
(result <- sp.pair(spmatrix))

#### Niche width and niche overlap
data(datasample)
niche.overlap.boot(datasample[,1:3], method = "levins")
niche.overlap(datasample, method = "levins")
niche.width(datasample[,1:3], method = "shannon")

##example turnover()
plotlab1 <- XYname(4,6)
xxx <- 1:240
dim(xxx) <- c(24, 10)
rownames(xxx) <- plotlab1

### Distance between each pair of plots
ddd <- dist(xxx)

### label matrix
labmat1 <- lab.mat(plotlab1)
yyy <- turnover(labmat1, ddd)

## geodist() example
## Paris
L1 = deg2dec(-2,20,14)
phi1 = deg2dec(48, 50, 11)
## Washington DC
L2 = deg2dec(77,03,56)
phi2 = deg2dec(38,55,17)

##High precision Great Circle distance
geodist(L1, phi1, L2, phi2)
```

data2mat

Convert field records to community matrix

Description

Convert field records to community matrix

Usage

```
data2mat(data = data)
```

Arguments

data A dataframe with the the following columns: species, plots or sites, abundance.

Value

Return a community matrix ready for computing diversity indices.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

None

Examples

```
data(testdata)
spmatrix <- data2mat(testdata)
```

datasample

A sample dataset for a community

Description

A sample community matrix containing 8 plots and 14 species, from Gutianshan, Zhejiang, China.

Usage

```
data(datasample)
```

Details

Values are the importance value for each species.

Source

Hu Zheng-hua, Qian Hai-Yuan, Yu Ming-jian. 2009. The niche of dominant species populations in *Castanopsis eyrei* forest in Gutian Mountain National Natural Reserve. *Acta Ecologica Sinica*. Vol.29, 3670-3677

Examples

```
data(datasample)
datasample
```

deg2dec *Degree to decimal*

Description

Convert latitude or longitude from degree to decimal format

Usage

deg2dec(h, m, s)

Arguments

h	Degree
m	Minute
s	Second

Details

Convert latitude or longitude from degree to decimal format.

Value

Degree of decimal format

Note

Places with eastern hemisphere should have longitude and southern hemisphere less than zero.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

Examples

```
## deg2dec() example
##Paris
L1 = deg2dec(-2,20,14)
phi1 = deg2dec(48, 50, 11)
##Washington DC
L2 = deg2dec(77,03,56)
phi2 = deg2dec(38,55,17)
```

`dist2list`*Convert distance matrix to pairwised list*

Description

Convert distance matrix to pairwised list

Usage

```
dist2list(dist)
```

Arguments

`dist` distance matrix

Details

Pairwise list with first column indicates the rows of the original distance matrix, second column indicates the columns indicates the rows of the original distance matrix, and the third indicats the values.

Value

Dataframe with three columns.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

Tuomisto, H. (2003). "Dispersal, Environment, and Floristic Variation of Western Amazonian Forests." *Science* 299(5604): 241-244.

See Also

Examples

```
##dist2list() example
x <- matrix(rnorm(100), nrow=5)
sampledata <- dist(x)
ddd <- dist2list(sampledata)
```

`freq.calc`*Compute species' relative frequency*

Description

Computing species' relative frequency as defined by the numbers of plots having a species divided by the total number of plots.

Usage

```
freq.calc(matr)
```

Arguments

`matr` A community matrix

Details

The input should be a standard community matrix with rows representing sites and columns representing species.

Value

A vector containing relative frequency for each species

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

None

Examples

```
data(testdata)
spmatrix <- data2mat(testdata)
freq.calc(spmatrix)
```

`geodist`*High precision Great circle distance between two places*

Description

High precision Great circle distance between two places assuming the earth is elliptic sphere.

Usage

```
geodist(L1, phi1, L2, phi2)
```

Arguments

L1	Longitude of first place in decimal format.
phi1	Latitude of first place in decimal format.
L2	Longitude of second place in decimal format.
phi2	Latitude of second place in decimal format.

Details

High precision great circle distance between two places assuming the earth is elliptic sphere.

Value

High precision great circle distance.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

phi2 = deg2dec(38,55,17)
##High precision Great Circle distance
```

```
geodist(L1, phi1, L2, phi2)
```

lab.mat	<i>Convert vector of XY labels to label matrix</i>
---------	--

Description

Convert vector of XY labels to label matrix

Usage

```
lab.mat(plotlab)
```

Arguments

plotlab Vector of XY labels

Value

XY label matrix

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

See Also

[turnover](#)

Examples

```
### lab.mat() example
plotlab1 <- XYname(4,6)
labmat <- lab.mat(plotlab1)
```

`lgeodist`*Low precision Great circle distance between two places*

Description

Calculating Great circle distance between two places assuming that the earth is sphere.

Usage

```
lgeodist(L1, phi1, L2, phi2)
```

Arguments

L1	Longitude of first place in decimal format.
phi1	Latitude of first place in decimal format.
L2	Longitude of second place in decimal format.
phi2	Latitude of second place in decimal format.

Value

Low precision great circle distance between two places.

Note

This function assuming that the earth is sphere.

list2dist	<i>Convert pairwise list to distance matrix</i>
-----------	---

Description

Convert pairwise list to distance matrix

Usage

```
list2dist(dat)
```

Arguments

dat dataframe with three columns

Details

Dataframe with first column as the column names in the distance matrix, second column as the rownames in the distance matrix, third column the values.

Value

distance matrix

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

list2dist(ddd)
```

niche.overlap	<i>Niche overlap between each pair of species</i>
---------------	---

Description

Compute niche overlap between each pair of species.

Usage

```
niche.overlap(mat, method = c("levins", "schoener",  
                             "petraitis", "pianka", "czech", "morisita"))
```

Arguments

mat	A community matrix with columns representing species, and rows representing plots.
method	A string specifying the name of the index.

Details

To add.

Value

A distance matrix contains niche overlap index between each pair of species.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

Zhang Jin-tun,(2004) Quantitative Ecology, Science Press, Beijing

Nicholas J. Gotelli. 2000. Null model analysis of species co-occurrence patterns. Ecology 81:2606-2621. <http://esapubs.org/archive/ecol/E081/022/EcoSim>

See Also

[niche.overlap.pair](#)

Examples

```
data(datasample)  
niche.overlap(datasample, method = "levins")
```

niche.overlap.boot *Bootstrap niche overlap indices*

Description

Bootstrap niche overlap indices

Usage

```
niche.overlap.boot(mat, method = c("pianka", "schoener", "petraitis",  
  "czech", "morisita", "levins"), times = 1000, quant = c(0.025, 0.975))
```

Arguments

mat	standard community matrix.
method	character string specifying the index.
times	Integer, representing the number of bootstrap samples to generate.
quant	Quantile of the bootstrap values.

Details

This function bootstraps the following niche overlap indices between each pair of species: \schoener: Schoener's niche overlap index\petraitis: Petraitis' niche overlap index\czech: Czechanowski index\morisita: Morisita's overlap index\levins: Levin's overlap index\ see more information from Gotelli, N(2009).\

Value

a data frame with each row for each pair of species the columns are "Observed", "Boot mean", "Boot std", "Boot CI1", "Boot CI2", "times"

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

Zhang Jin-tun,(2004) Quantitative Ecology, Science Press, Beijing\
Nicholas J. Gotelli. 2000. Null model analysis of species co-occurrence patterns. Ecology 81:2606-2621. <http://esapubs.org/archive/ecol/E081/022/EcoSim>

See Also

[niche.overlap.boot.pair](#)

Examples

```
data(datasample)
niche.overlap.boot(datasample[,1:4], method = "pianka")
niche.overlap.boot(datasample[,1:4], method = "schoener")
niche.overlap.boot(datasample[,1:4], method = "czech")
niche.overlap.boot(datasample[,1:4], method = "levins")
```

```
niche.overlap.boot.pair
```

Bootstrap the niche overlap indices

Description

bootstrap the niche overlap indices between a pair of species. This is an internal function used by niche.overlap.boot, use niche.overlap.boot instead.

Usage

```
niche.overlap.boot.pair(vectorA, vectorB, method = c("levins",
  "schoener", "petraitis", "pianka", "czech", "morisita"),
  times = 1000, quant = c(0.025, 0.975))
```

Arguments

vectorA	A numeric vector containing species A's abundance or importance value.
vectorB	A numeric vector containing species B's abundance or importance value.
method	Name of the index to use.
times	Number of bootstraps
quant	Confidence intervals of the bootstrap results.

Value

This function will return a vector containing: \ "Observed", \ "Boot mean", \ "Boot std", \ "Boot CI1", \ "Boot CI2", \ "times" \

Note

This is an internal function, please use niche.overlap.boot.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

See Also[niche.overlap.boot](#)**Examples**

```
data(datasample)
niche.overlap.boot.pair(datasample[,1], datasample[,2], method = "levins")
```

niche.overlap.pair *Compute niche overlap index between two species*

Description

Compute niche overlap index between two species. This is an internal function, used [niche.overlap](#) instead.

Usage

```
niche.overlap.pair(vectA, vectB, method = c("pianka",
      "schoener", "petraitis", "czech", "morisita", "levins"))
```

Arguments

vectA	A numeric vector containing species A's abundance or importance value
vectB	A numeric vector containing species B's abundance or importance value
method	Niche overlap index

Details

None

Value

The niche overlap index

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

[niche.overlap](#)

Examples

```
data(datasample)
niche.overlap.pair(datasample[,1],datasample[,2], method = "levins")
```

niche.width	<i>Niche width</i>
-------------	--------------------

Description

Compute niche width for all the species in a community.

Usage

```
niche.width(mat, method = c("shannon", "levins"))
```

Arguments

mat	A community matrix with columns representing species, and rows representing plots.
method	Character string showing the name of the index.

Value

A vector containing niche width for all the species in the community.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

Zhang Jin-tun,(2004) Quantitative Ecology, Science Press, Beijing

See Also

niche.width(datasample, method = "levins")
niche.width(datasample, method = "shannon")
```

sp.assoc

*Analyzing species association***Description**

Analyzing species association

Usage

sp.assoc(matr)

Arguments

matr standard community matrix , with rows representing sites and columns representing species.

Details

Computations are based on the following formula.

If, N: Number of plots.

S: Number of species.

n: Number of plots occupied by certain species.

Tj: total number of species for each plot. \bar{t} : mean species number for all the plots.

Then: Variance of species relative frequency is: $\sigma^2_T = \sum_{i=1}^S P_i(1-P_i)$.

Variance of species number is: $S^2_T = (\sum_{j=1}^N (T_j - \bar{t})^2) / N$.

Species relative frequency: $P_i = \frac{n_i}{N}$.

Variance ratio:

If $VR > 1$ Positively associated,

If $VR < 1$ Negative associated

$$VR = \frac{S^2_T}{\sigma^2_T}$$

W: used in comparison with chi square with n degrees of freedom.

$$W = VR * N$$
Value

Variance ratio, W, Chisq, etc, see details

pi	Species frequency
N	Number of plots
S	Number of species
Tj	Total number of species for each plot
Numspmean	Mean number of species

sigmaTsq	Variance of species relative frequency
STsq	Variance of species number
var.ratio	Variance ratio
W	W statistic value: used in comparison with chi square.(n)

See also [sp.pair](#) for association between each pair of species.

Examples

```
data(testdata)
spmatrix <- data2mat(testdata)
sp.assoc(spmatrix)
```

sp.pair

Species association between each pair of species

Description

Compute species association between each pair of species.

Usage

```
sp.pair(matr)
```

Arguments

matr Standard community matrix, with rows representing sites and columns representing species.

Details

If a, b, c, d denote the co-occurrence the two species A and B, where:

a = number of plots occupied both by A and B.

b = number of plots only have A.

c = number of plots only have B.

d = number of plots without A or B.

$N = a+b+c+d$

Then, it is possible to compute:

Chi square (Yate's correction): $\chi^2 = \frac{(((a*d-b*c)-0.5*N)^2)*N}{(a+b)*(a+c)*(b+d)*(c+d)}$

V ratio: $V = \frac{(a+d)-(b+c)}{a+b+c+d}$

Jaccard index: $Jaccard = \frac{a}{a+b+c}$

Ochiai index: $Ochiai = \frac{a}{\sqrt{(a+b)*(a+c)}}$

Dice index: $Dice = \frac{2*a}{2*a+b+c}$

The Association Coefficient(AC):

if $a*d \geq b*c$:

$AC = \frac{a*d - b*c}{(a+b)*(b+d)}$

if $a*d < b*c$ and $a \leq d$:

$AC = \frac{a*d - b*c}{(a+b)*(a+c)}$

if $a*d < b*c$ and $a > d$:

$AC = \frac{a*d - b*c}{(b+d)*(c+d)}$

Point correlation coefficient

(PCC):

$PCC = \frac{a*d - b*c}{\{(a+b)*(a+c)*(c+d)*(b+d)\}}$

Value

chisq	Chi Square matrix
V	V positive or negative association
Ochiai	Ochiai's index
Dice	Dice's index
Jaccard	Jaccard's index
Pearson	Pearson's correlation coefficient
Spearman	Spearman's rank correlation coefficient
PCC	Point correlation coefficient
AC	Association coefficient

See Also

See Also as [sp.assoc](#) for computing association for all the species.

Examples

```
data(testdata)
spmatrix <- data2mat(testdata)
result <- sp.pair(spmatrix)
```

splist	<i>A sample dataframe showing species taxonomic information (Deprecated)</i>
--------	--

Description

A sample dataframe containing the checklist of species used in `add.col()`

Usage

```
data(splist)
```

Format

A data frame with 9 observations on the following 3 variables.

species a factor with levels sp1 to sp8
 genera a factor with levels gen1 to gen6
 family a factor with levels fam1 to fam5

References

None

Examples

```
data(splist)
data(testdata)
```

sub.sp.matrix	<i>Subset species based on relative frequency</i>
---------------	---

Description

Subset species based on relative frequency.

Usage

```
sub.sp.matrix(spmatrix, freq = 0.5, common = NULL)
```

Arguments

spmatrix	a standard community matrix with rows representing sites and columns representing species.
freq	The relative frequency, species with higher relative frequency will be kept in the output.
common	The number of most common species to keep.

Details

sub.sp.matrix will select the species whose relative frequency above 0.5 (default), or select certain number of species based on relative frequency.

Value

A subset matrix of species with high relative frequency.

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>

References

None

See Also [subset](#)

Examples

```
library(vegan)
data(BCI)
## Select the species whose relative frequency
## more than 0.5, from BCI data
sub <- sub.sp.matrix(BCI, freq = 0.5)
## Select the top 30 species according to relative frequency
sub <- sub.sp.matrix(BCI, common = 30)
```

testdata

A sample dataset s

Description

A sample dataset

Usage

```
data(testdata)
```

Format

A dataframe with 11 observations on the following 3 variables.

plotname a factor with levels plot1, plot2, plot3.

species a factor with levels sp1 to sp7.

abundance a numeric vector indicating number of individuals appeared in each plot.

Examples

```
data(testdata)
testdata
```

turnover

Calculating species turnover

Description

Calculating species turnover based on the mean value between focus quadrat and their neighbours.

Usage

```
turnover(lab.mat, dist.mat, type = c("quart", "octal"))
```

Arguments

lab.mat	matrix of quadrat labels.
dist.mat	distance matrix between each pair of quadrats
type	"quart" indicates four neighbouring quadrats, "octal" indicate eight neighbouring quadrats.

Details

species turnover based on the mean value between centred quadrat and its neighbours.

Value

matrix with species turnover.

### Distance between each pair of plots
ddd <- dist(xxx)
### label matrix
labmat1 <- lab.mat(plotlab1)
yyy <- turnover(labmat1, ddd)
```

XYname

Generating vector of XY labels

Description

Generating vector of XY labels by providing number of rows and columns

Usage

```
XYname(x, y)
```

Arguments

x	Number of X labels
y	Number of Y labels

Value

Vector of XY labels

Author(s)

Jinlong Zhang <jinlongzhang01@gmail.com>
